## 1 About Me and This Course

My interests in Economics and Data Science can be varied, and have gotten less specific the more i study Economics. Originally I was very interested in Monetary Policy as well as the work of the Federal Reserve, so generally very macro areas of research. However, as I get further, researching municipalities as entities and their efforts to capture economic growth has gotten more interesting to me, and I've focused in more on that as I've gone on. From this class, I want to take more advanced techniques that I can use to analyze data as well as just more practice so that I can do it more consistently. If i can leave this feeling comfortable using Github and LaTeX as well as just a firmer grasp of analyzing and cleaning data i'll be very happy. If i can look at local government policy in someway that's new (that's not also my master's thesis) that would be great, but I'm trying to keep an open mind.

## 2 Equation

$$a^2 + b^2 = c^2$$
